# **A1000 Cheat Sheet (Open Loop Vector)**

The following procedure is a supplement to other documentation supplied with this equipment and will guide the user in properly wiring the A1000 and motor. It will also show the user how to configure the A1000 in open loop vector mode for a general purpose application.

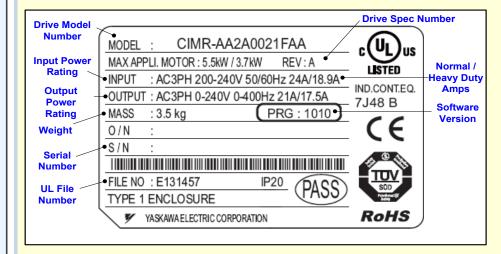

Danger: *Improper* wiring can and will cause bodily harm as well as damage to the equipment.

When installing the system, be sure to follow good wiring practices and all applicable codes. Ensure that the mounting of components is secure and that the environment, such as extreme dampness, poor ventilation, etc. will not cause system degradation.

Please read this cheat sheet and other documentation provided with the A1000 thoroughly before attempting any installation.

#### Step A1000 Model **Identification and Mounting**

To make sure you received the correct model, it is essential to verify the A1000 nameplate with your order and make sure the A1000 has the correct rating so it can be used with your motor. Please check the nameplate information as shown in the example below.

- Check that the available power will meet the *input* power requirements.
- Ensure that the **output power** from the A1000 is compatible with the motor requirements.
- In the case of systems with more than one A1000, follow the above procedure for each A1000 and motor

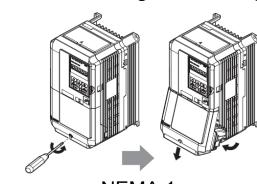

#### Mounting the A1000

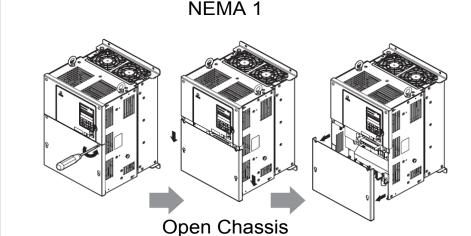

The mounting of the A1000 is extremely important regarding environment and accessibility. Depending on your system, there are various models available and the mounting dimensions (footprint) may be different. Because the mounting procedure is fairly extensive, it is beyond the scope of this document; the user is referred to the A1000 User Manual (Document No. SIEP C710606 21A) received with the A1000, Section 2.2 Mechanical Installation. Match the model that you received and follow the procedure described in the manual to ensure a safe and functional installation. In cases where the system has more than one A1000, refer to the proper clearances required for adequate ventilation. Please pay particular attention to:

- The clearances to be maintained around the enclosure for adequate ventilation.
- The environmental specifications such as avoiding excessive dampness, extreme temperatures, chemical exposure, corrosive areas, etc. to avoid damage to the equipment and to maintain safety.

#### **Removing and Attaching the Terminal Cover**

Improper removal of the A1000 terminal cover as well as front cover can cause extensive damage to the A1000. To avoid damage to these items, please pay particular attention to the A1000 User Manual, Document No. SIEP C710606 21A, Section 3.5, Removing and Attaching the Terminal Cover.

Step

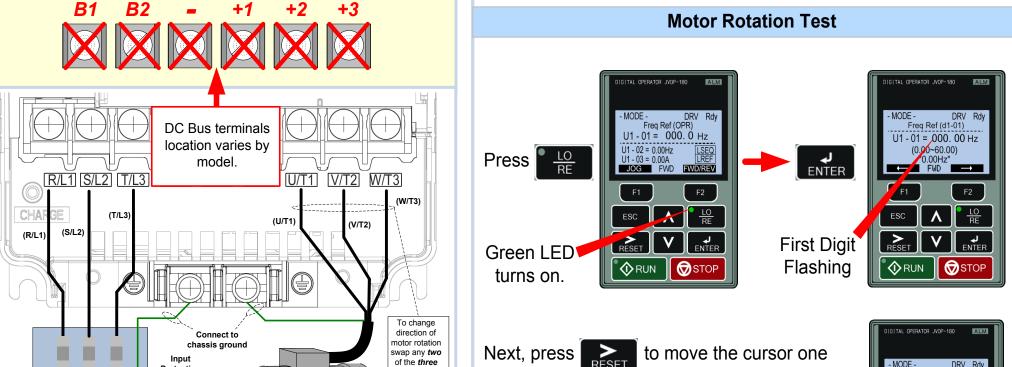

### **Connect Motor and Line Power**

Fig.1 & 2 below show the electrical connections for the input power and motor terminals for various A1000 models. Select the proper diagram for the model you are installing (see Step 1). WITH POWER OFF make the appropriate connections.

Make sure to follow good wiring practices and all applicable codes. Ensure that the equipment is grounded properly as shown in fig. 1

DANGER; LETHAL VOLTAGES ARE PRESENT- Before applying power to the A1000, ensure that the terminal cover is fastened and all wiring connections are secure. After the power has been turned OFF, wait at least five minutes until the charge indicator extinguishes <u>completely</u> before touching any wiring, circuit boards or

WARNING DO NOT CONNECT ANY OF THE FOLLOWING TERMINALS TO EARTH GROUND

Models: 2\_0110 & Larger and 4\_0058 & Larger Make sure the A1000 has been properly sized for single phase input power. For best performance, the drive input supply voltage must be at least equal to or greater than the motor rated voltage.

Step

# **Check Motor Direction** (Motor uncoupled from Load)

In this step the motor is checked for proper direction and operation. This test is to be performed solely from the digital operator. Apply power to the A1000 after all the electrical connections have been made and protective covers have been re-attached. At this point, DO NOT RUN THE MOTOR, the Digital Operator should display as shown in Fig. 3.

**U1-02 Output Frequency** 

Please refer to the A1000 User Manual, (Document No. SIEP C710606 21A) on how to access other drive monitors. Step 6

# **Selecting Start/Stop and Speed Method**

This step shows how to setup the sequence and reference method of the A1000. The sequence method determines how the A1000 drive receives its start and stop command and the reference method determines how the speed of the motor is controlled. Make sure all protective covers have been re-attached and power is turned on. DO NOT RUN THE MOTOR.

This section may require you to change one or more A1000 parameters. Please refer to Step 5 for a detailed explanation on how to change parameters.

#### SELECT SPEED METHOD

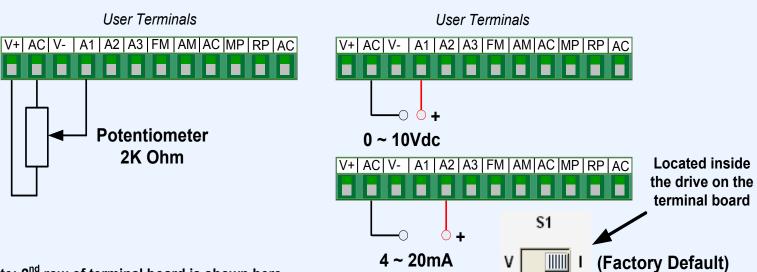

b1-01

1. Adjust motor speed / frequency from the Digital Operator

Go to parameter b1-01, set value to b1 - 01 = 0 \*1\* Freq Ref (d1-01) U1 - 01 = 020.00 Hz $(0.00 \sim 60.00)$ To adjust frequency use

2. Adjust motor speed / frequency from external terminals (0 - 10V / 4 - 20mA Signal)

(Factory Default) Go to parameter b1-01, set value to b1 - 01 = 1 \*1\*

#### SELECT START / STOP CONTROL METHOD

Run Source 1

Operator

b1-02

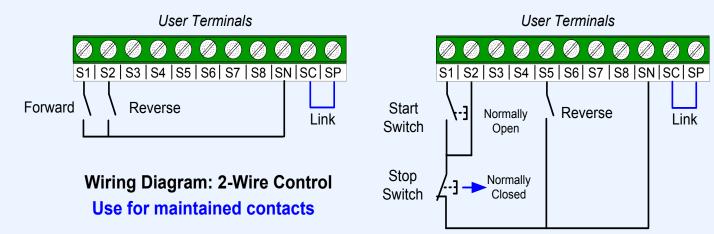

STOP 1. Start / Stop Control from Digital Operator

Go to parameter b1-02, set value to b1 - 02 = 0 \*1\*

Note: 2<sup>nd</sup> row of terminal board is shown here.

2. Start / Stop Control from external terminals (switch or relay contact)

( Factory Default) Go to parameter b1-02, set value to b1 - 02 = 1 \*1\* Digital Inputs

Note: 3<sup>rd</sup> row of terminal board is shown here.

Wiring Diagram: 3-Wire Control **Use for momentary contacts** (Set Parameter A1-03 to 3330)

NOTE: It is beyond the scope of this document to program the A1000 drive for network communication control. Please refer to the refer to the A1000 User Manual, (Document No. SIEP C710606 21A) for this selection.

Step

## **Quick Start Parameters**

The following table lists the general purpose application parameters as well as frequently asked questions.

This section may require you to change one or more A1000 parameters. Please refer to Step 5 for a detailed explanation on how to change parameters.

#### **GENERAL PURPOSE APPLICATION PARAMETERS**

Parameter	Default Value	Description	Comments
b1-01	1	Reference Source Speed Control Method	0 = Digital Operator (Adjust Motor Speed from keypad) 1 = Terminals (Speed Pot. / 0 – 10V / 4—20mA)
b1-02	1	Run Source / Start/Stop Control Method	0 = Digital Operator (Start/Stop motor from keypad) 1 = Terminals (Start/Stop using external contact / switch)
b1-03	1	Stop Method Selection	0 = Ramp to stop (Motor ramps down at stop command) 1 = Coast to stop (Motor freewheels at stop command)
b1-04	0	Reverse Operation	0 = Allow motor to run in reverse direction 1 = Reverse direction prohibited
C1-01	10.0 sec.	Acceleration Time	The time it takes to ramp up from 0 to maximum motor speed.
C1-02	10.0 sec.	Deceleration Time	The time it takes to ramp down from maximum motor speed to 0.
C6-01	0	Heavy / Normal Duty	0 = Heavy Duty (Use for conveyor, mixer, applications) 1 = Normal Duty (Use for fan and pump applications)
d1-01	0.00 Hz	Frequency Reference	Frequency setting when speed is set from the keypad.
d2-01	100.0 %	Frequency Upper Limit	Maximum motor speed allowed (e.g. 100 % = Max rpm)
d2-02	0.0 %	Frequency Lower Limit	Minimum motor speed allowed (e.g. 100 % = Max rpm)
E2-01	*	Motor Rated Current	Motor nameplate current
L1-01	1	Motor Overload Selection	0 = Disabled 1 = Standard Fan Cooled Motor 2 = Standard Blower Cooled Motor 3 = Vector Duty Motor
L1-02	1.0 min	Motor Overload Time	Sets the motor thermal overload protection time.

#### FREQUENTLY ASKED QUESTIONS

Question: How do I reset the drive back to factory default settings?

**Answer:** Go to parameter A1-03 and set value **2220** for 2 wire control or **3330** for 3 wire control

(Please refer to Step 6 for wiring diagram)

**Question:** How do I adjust the time it takes the motor to speed up or slow down?

Answer: Adjust the acceleration time parameter C1-01 and deceleration time C1-02.

Question: How do I prevent my drive from tripping on an OV fault (overvoltage) while my motor is ramping down?

**Answer:** Increase deceleration time parameter C1-02.

Question: How do I prevent my drive from tripping on an OL1 fault (overload) while my motor is ramping down?

**Answer:** Verify motor rated current parameter E2-01 and motor overload parameter settings

L1-01 Motor overload selection, L1-02 Motor overload protection time.

**Answer:** Increase the value of parameter E1-04 Maximum Frequency

**Question:** I want to run my motor above the nominal motor speed?

Warning! Verify that the motor and system allow for this.
